

ABSTRACT

A modified object information window includes a custom field area and an operator's note area, which enable operators to define attributes of their liking for an object. One or more custom fields may be accommodated in the custom field area, each being associated with a custom attribute field. The operator note area comprises a note text box allowing operators to leave notes pertaining to specific objects. These additional areas enable an operator to define and search on attributes relevant to that particular network. The objects associated with the object information window can be selected from the window, allowing the operator to also perform further analysis and repair objects from this window.
